

ResolveDesk AI — Technical Troubleshooting Guide

Common Issues & Resolutions

Browser Caching & Page Loading Errors

If UI elements fail to load or display stale content:

1. Reload the page using a hard refresh (Ctrl + F5 on Windows, Cmd + Shift + R on Mac).
2. Clear browser cookies and cache under Settings > Privacy > Clear Browsing Data.

WebSocket Connection Disconnects

ResolveDesk uses WebSockets to sync board updates in real time. If you see a 'Disconnected from server' warning:

1. Check your internet connection status.
2. Disable active VPNs or proxy servers that may block standard WebSockets.
3. Refresh the page to trigger automatic socket reconnection.

Browser Compatibility

Ensure your browser is updated. We fully support Chrome (v100+), Firefox (v100+), Safari (v15+), and Edge (v100+). We do not support legacy Internet Explorer or old browser builds.

SSO and Advanced SSO Failure Resolutions

Resolving SAML / SSO Login Loop Errors

If your team is redirected back to the login page repeatedly during single sign-on authentication:

1. Contact your system admin to verify that the SAML certificate in Okta or Azure AD matches the metadata stored in ResolveDesk.
2. Clear the browser cookie storage cache for 'resolvedesk.ai' and try logging in again.
3. Use the backup SSO emergency URL provided during enterprise setup to bypass okta loops.

File Attachment Upload Failures

If task file uploads return error code 413, check that the file size is under the 25 MB limit for standard attachments. Verify that you have sufficient storage remaining in your workspace quota (Billing > Storage Limits).
